

### How does your team administer the nodes (more options possible)?

1. We have developed our own in-house key management system, using Ledger Nano S. To login to a node, you must possess a Ledger that has previously been registered with the server. The Ledger challenges the user for a pin number.

You can see a brief demonstration of our setup here: <https://youtu.be/2xnXnCTLRCA>

2. We have developed an in-house bot, that queries every node via it's API, to get it's status. If a node doesn't respond, is too slow to respond, or provides results not in line with the overall network, team members will be notified.

3. System admins will follow communications & guidelines from Factom Inc and stay active in the general Authority Set channels.
